

A METHOD AND SYSTEM FOR IMPLEMENTING WIRELESS DATA
TRANSFERS BETWEEN A SELECTED GROUP OF MOBILE COMPUTING
DEVICES

5 ABSTRACT OF THE DISCLOSURE

A wireless communication method for selective transmission of data among a group of mobile computing devices. A user's device is used to broadcast a query to determine a group of mobile computing devices within communications range. A list of resulting mobile computing devices is then presented to the user through the device's interface. The user selects at least one of the mobile computing devices from the list for a data transfer. The data transfer is then performed to the selected at least one mobile computing device. Upon completion of the transfer, a confirmation is presented to the user. In this manner, wireless data transfers can be performed with a number of different mobile computing devices within communications range. The user can select a number of mobile computing devices from the list and perform the data transfer to each of the selected number in a single step. The data transfer is performed using a wireless RF communications link. The wireless RF communications link can be compatible with a version of the Bluetooth specification.
